

## Differential Equations

S.No	Chapter	Concepts/Formulae	
1	<b>Differential Equations</b>	<b>1.1</b>	<p><b>Differential Equations</b> An equation involving derivatives of dependent variable with respect to independent variable(s)</p> <ul style="list-style-type: none"> <li>Order of a differential equation is the order of the highest order derivative occurring in the differential equation.</li> <li>Degree of a differential equation is the highest power (exponent) of the highest order derivative in it.</li> </ul>
		<b>1.2</b>	<p><b>Solution of a Differential equation</b> A function which satisfies the given differential equation is called its solution.</p> <ul style="list-style-type: none"> <li>The solution which contains as many arbitrary constants as the order of the differential equation is called a <b>general solution</b>.</li> <li>The solution which is free from arbitrary constants is called <b>particular solution</b>.</li> </ul>
		<b>1.3</b>	<p><b>Variable separable</b> This method is used to solve equations in which variables can be separated i.e terms containing y should remain with dy &amp; terms containing x should remain with dx.</p>
		<b>1.4</b>	<p><b>Homogeneous Differential Equation</b> A differential equation which can be expressed in the form <math>\frac{dy}{dx} = f(x,y)</math> or <math>\frac{dx}{dy} = g(x,y)</math> where, f(x, y) &amp; g(x, y) are homogenous functions Steps to solve a differential equation of type: <math>\frac{dy}{dx} = F(x,y) = g\left(\frac{y}{x}\right)</math> .....(1)</p> <ul style="list-style-type: none"> <li>Substitute <math>y=v.x</math> .....(2)</li> <li>Differentiate (2) wrt to x <math>\frac{dy}{dx} = v + x \frac{dv}{dx}</math> .....(3)</li> <li>Substitute &amp; separate the variables</li> </ul>

# IMPORTANT FORMULAE

			$\frac{dv}{g(v) - v} = \frac{dx}{x}$ <ul style="list-style-type: none"> <li>Integrate, <math>\int \frac{dv}{g(v) - v} = \int \frac{dx}{x} + C</math></li> </ul>
		<b>1.5</b>	<p><b>Linear Differential Equation</b></p> <ul style="list-style-type: none"> <li> <math>\frac{dy}{dx} + Py = Q</math> where, P and Q are constants                      or functions of x only                      Integrating factor (I.F) = <math>e^{\int P dx}</math>                      Solution: <math>y \text{ (I.F)} = \int (Q \times \text{I.F}) dx + C</math> </li> <li> <math>\frac{dx}{dy} + P_1y = Q_1</math> where, <math>P_1</math> &amp; <math>Q_1</math> are constants                      or functions of y only                      Integrating factor (I.F) = <math>e^{\int P_1 dy}</math>                      Solution: <math>x \text{ (I.F)} = \int (Q \times \text{I.F}) dy + C</math> </li> </ul>
